## SUMMARY

Full-stack Software Engineer with 5 years of experience building scalable distributed systems using Java, React, and Kafka. Proven track record designing high-throughput backend services, event-driven architectures, and modern web applications at Goldman Sachs. Strong engineering fundamentals across CI/CD, system observability, fault tolerance, and infrastructure-as-code (Terraform).

## EXPERIENCE

### Associate - Goldman Sachs, Bangalore

Jan 2024 - Present

- Solely designed and built the **Datacenter Server Repurpose Platform** — a distributed, microservices-based system in **Java** using BPMN-orchestrated workflows to automate provisioning; reduced manual effort by 50% and cut provisioning time from hours to minutes.
- Built a high-throughput, fault-tolerant data reconciliation pipeline processing **2.5M+ records** across heterogeneous systems, achieving 100% data consistency at scale through idempotent batch processing.
- Led backend development for the **Capacity Provisioning Platform**, a Java service enabling automated resource allocation across 30+ international data centers and improving utilization efficiency by 50%.

### Analyst - Goldman Sachs, Bangalore

Jun 2021 - Dec 2023

- Engineered a **fault-tolerant, event-driven service using Kafka** with auto-retry, dead-letter handling, and real-time monitoring dashboards; reduced silent failures by 30% and improved system observability.
- Developed the **Workorder Sync Service** in Java to integrate third-party systems with internal platforms via REST APIs with caching, reducing p99 latency and eliminating synchronous dependency bottlenecks.
- Built **React-based operational dashboards** backed by Elasticsearch for real-time analytics, improving data analysis speed by 30% and user satisfaction by 50%.
- Deployed region-isolated infrastructure with dedicated CI/CD pipelines, ensuring 100% compliance and data segregation across restricted regions.

### Intern - Goldman Sachs, Bangalore

May 2020 - Jun 2020

- Built **Sky Console**, a full-stack web application using **ReactJS** and AWS (Lambda, API Gateway, DynamoDB) with Terraform IaC; improved deployment speed by 50% and established a reusable serverless infrastructure pattern.

## PROJECTS

### Datacenter Visibility Platform | *ReactJS, Java REST APIs, LLM-assisted development (Devin AI)*

- Architected and shipped a full-stack **React** platform with a Java REST backend for real-time visibility into datacenter power metrics, rack/server topology, and asset metadata across global infrastructure.
- Integrated internal inventory APIs to surface real-time server location and capacity utilization; leveraged Devin AI to accelerate frontend delivery, personally evaluating all generated code for production correctness.

## TECHNICAL SKILLS

**Languages:** Java, JavaScript, Python, SQL

**Frontend:** ReactJS, Vue.js (familiar)

**Distributed Systems & Streaming:** Kafka, Event-Driven Architecture, Microservices, Dropwizard, Spring (familiar), REST APIs, Fault Tolerance, Dead-letter Queues

**Databases:** MySQL, PostgreSQL (academic/working knowledge), Elasticsearch, Redis (familiar)

**Cloud & DevOps:** AWS (Lambda, API Gateway, S3, DynamoDB) (familiar), Terraform, IaC, Docker (familiar), CI/CD, BPMN

**Concepts:** Distributed Systems, System Design, High Availability, Observability, Data Structures & Algorithms

## EDUCATION

### Shri GS Institute of Technology and Science

Aug 2017 - Jun 2021

B.Tech. in Information Technology | CGPA: 8.43/10 | *Mukhyamantri Medhavi Scholarship* (top-ranked students in Madhya Pradesh)
